

MYSEJATERA REGISTRATION, VERIFICATION, AND MYDIGITAL ID INTEGRATION

1. Introduction and the Evolution of MySejahtera MySejahtera is a comprehensive national mobile application developed by the Ministry of Health Malaysia (MOH). Originally launched in 2020 as a critical tool to augment pandemic management through contact tracing, health declarations, and COVID-19 vaccination management, the application has since evolved far beyond its initial purpose.

Today, MySejahtera stands as the primary digital health portal for all residents of Malaysia. It actively supports the nation's broader digital health transformation, serving as a centralized repository for personal health records, the National Immunisation Programme (NIP), dental and medical appointments at public clinics, blood donation records, and organ donation pledges.

Because MySejahtera holds sensitive personal medical data, the registration and verification processes have become significantly more rigorous. A basic registration is no longer sufficient to unlock the app's full capabilities; users must now undergo stringent identity verification processes, including Electronic Know Your Customer (eKYC) protocols and the newly introduced MyDigital ID integration, to ensure absolute data privacy and security.

2. Pre-Requisites and App Installation Before initiating the registration process, users must ensure they have the correct hardware and software prerequisites.

- **Device Compatibility:** The MySejahtera application is cross-platform but requires modern operating systems to function securely. Users must have Android 4.4 or higher, or iOS 12 or higher.
- **Official Downloads Only:** Users must exclusively download the application from official, secure repositories: the Apple App Store for iOS devices, the Google Play Store for Android devices, or the Huawei AppGallery. Users are strongly warned against downloading third-party APK files from unofficial websites, as these may contain malware designed to steal personal health data or intercept banking OTPs.
- **Internet Connection:** A stable internet connection (Wi-Fi or mobile data) is required throughout the registration and verification process.

3. The Initial Registration Process (Creating a MySJ ID) The first step to accessing the platform is creating a base account, known as the MySJ ID. The MySJ ID serves as the primary username and is tied to either a mobile phone number or a personal email address.

Step-by-Step Registration Guide:

- **Step 1: Launch and Initiate.** Open the newly installed MySejahtera application. On the primary landing screen, tap on the 'Register Here' or 'Sign Up' button.
- **Step 2: Choose Registration Method.** The system will prompt the user to enter a mobile phone number. By default, the country code is set to Malaysia (+60). Alternatively, if the user prefers to tie their account to an email, they can tap the link at the bottom that says, 'I would like to use Email to Register'.
- **Step 3: One-Time Password (OTP) Verification.** If a mobile number was entered, the user will receive a 6-digit OTP via SMS. These automated SMS messages will strictly come from official government shortcodes such as 68808, 63001, or 68088. If an email address was used, the user must check their inbox (or spam folder) for an OTP or a direct confirmation link.
- **Step 4: Input Personal Details.** Once the OTP is validated, the user is directed to the registration form. Here, accurate data entry is critical. The user must input their Full Name (exactly as it appears on their official identification), Identity Card (MyKad) Number for Malaysians or Passport Number for foreigners, Date of Birth, Gender, Current Residential Address, and State.
- **Step 5: Password Creation.** The user must create a strong, alphanumeric password. This password, combined with the MySJ ID (the phone number or email used in Step 2), will be the standard login credentials.
- **Step 6: Activation.** After clicking 'Confirm' and 'Submit', the system will process the data. Within a few moments, a 'Successful Registration' prompt will appear. The user can now return to the main login page and sign in using their newly created MySJ ID and password.

4. Account Verification via eKYC (Electronic Know Your Customer) Completing the initial registration only grants the user a "Basic" profile. A basic profile allows for simple functions like viewing infectious disease hotspots. However, to access sensitive modules like digital health records, vaccination certificates, and clinic appointments, the user's profile must obtain a "Verified" (SAH) status.

Verification is conducted through an eKYC process, a remote identity verification standard governed by Bank Negara Malaysia guidelines and adapted by MOH. This ensures that the person logging into the app is genuinely the owner of the MyKad or Passport registered.

The eKYC Verification Steps:

- **Initiation:** Tap on the 'Profile' tab located at the bottom right of the MySejahtera home screen. If the account is unverified, a red or prominent banner will instruct the user to 'Verify Your Account' (Sahkan Akaun Anda). Tap this banner.
- **Document Scanning:** The app will activate the smartphone's camera. The user must place their physical identification document on a flat surface. For Malaysians, this is the MyKad; for foreigners, the Passport biodata page. The user must capture a clear, glare-free picture of the front of the document. For MyKad, a picture of the back of the card is also required.
- **Liveness Detection (Selfie):** After the document is captured, the system requires a real-time selfie to match the face of the user with the photograph on the official document.
- **Submission and Processing:** The encrypted images are securely transmitted to government databases (such as the National Registration Department - JPN) for facial mismatch and document authenticity checks.

Tips for a Successful eKYC Pass:

- Ensure the room is brightly lit, avoiding shadows across the face or the document.
- Remove any plastic covers from the MyKad, as reflections and glare will cause the OCR (Optical Character Recognition) scanner to fail.
- Do not hold the MyKad in your hand while taking the selfie. The document scan and the selfie are two distinct steps.
- If the verification fails repeatedly (users are typically given 3 to 5 automated attempts), the application will route the user to the MySejahtera Helpdesk for a manual review process by an MOH officer.

5. Integration with MyDigital ID As part of the Malaysian government's push towards a unified digital ecosystem, MySejahtera has heavily integrated with MyDigital ID. MyDigital ID is a national initiative providing a secure and trusted digital identity solution. It does not replace the physical MyKad, but rather acts as a digital cryptographic certificate verifying a citizen's identity across multiple online government portals using a Single Sign-On (SSO) mechanism.

How MyDigital ID Enhances MySejahtera: By linking MyDigital ID to MySejahtera, users no longer need to remember separate MySJ passwords. Furthermore, logging in via MyDigital ID automatically fulfills the highest tier of eKYC verification, instantly granting the user full access to all sensitive health modules without needing to re-scan their MyKad.

Registration and Linking Process:

- **Users cannot create a MyDigital ID directly inside MySejahtera. They must first download the standalone 'MyDigital ID' application or visit a physical MyDigital ID registration kiosk.**
- **To register for MyDigital ID online, users enter their email, perform a highly secure eKYC facial scan, and set a unique MyDigital ID password. The digital certificate is then cryptographically bound to the user's specific smartphone device.**
- **Once the MyDigital ID is active on the smartphone, the user can open the MySejahtera app. On the login screen, instead of entering the MySJ ID, the user selects 'Log in with MyDigital ID'.**
- **The MySejahtera app will instantly communicate with the MyDigital ID app, verify the certificate, and log the user directly into their fully authenticated MySejahtera profile.**

6. Managing Dependents in MySejahtera One of the most vital features of MySejahtera is the ability to manage the healthcare of family members who do not possess their own smartphones, such as infants, young children, or elderly parents. This is done through the 'Dependent' (Tanggungan) module.

- **Registering a Dependent:** From the home screen, the user navigates to the 'COVID-19 Vaccination' or 'Dependent' menu and selects 'Add Dependent'. The user must fill in the dependent's details, including their relationship (e.g., child, parent, spouse), MyKid/MyKad number, age, and gender.
- **Digitalisation of the National Immunisation Programme (NIP):** For parents of newborn babies, registering the infant as a dependent is crucial. Once registered, public clinics update the infant's routine vaccination records (like Hepatitis B, Polio, MMR) directly into the parent's MySejahtera app. This replaces the physical "pink or blue books," ensuring the digital vaccination certificate is permanently safe.
- **Main Guardian vs. Co-Guardian:** The account that first registers the child is designated as the 'Main Guardian' (Penjaga Utama). However, childcare is a shared responsibility. The Main Guardian can appoint the other parent or family members (like grandparents) as a 'Co-Guardian'. The Main Guardian initiates a transfer or sharing request, allowing the Co-Guardian to view the child's health records and bring the child to clinic appointments using their own MySejahtera app.
- **Data Removal:** If a dependent passes away, or if a child reaches an age where they obtain their own smartphone and create their own MySJ account,

the Main Guardian can request the removal or unlinking of the dependent's data via the MySejahtera Helpdesk.

7. Core Features Unlocked Post-Registration Once registered and verified, users gain access to a suite of critical healthcare features:

- **Janji Temu (Appointments):** Users can book slots for out-patient treatments, dental check-ups, smoking cessation clinics, and family planning services at any Klinik Kesihatan (Public Health Clinic) nationwide.
- **Health Records (Rekod Kesihatan):** Users can view historical records of health screenings conducted at government facilities, including blood pressure, BMI, blood sugar levels, and cholesterol readings.
- **Infectious Disease Tracker:** Utilizing location services, the app provides alerts regarding local outbreaks of diseases such as Dengue, Rabies, Hand Foot and Mouth Disease (HFMD), and COVID-19 within the user's immediate radius.
- **Blood Donation:** Donors can link their blood donation booklets to the app, track their donation history, and receive notifications when national blood banks require their specific blood type.

8. Account Maintenance: Updating the MySJ ID It is common for users to change their mobile phone numbers or email addresses over time. Since the MySJ ID is tied directly to these contact points, updating this information is critical to avoid being locked out of the health portal.

Users must update their MySJ ID before they lose access to their old phone number. Inside the app, users navigate to 'Profile', select 'Update MySJ ID', and input their new phone number or email. An OTP will be sent to the new contact method to verify ownership. Once verified, the login credential is changed immediately.

If a user loses their phone and cannot log in, they must use the 'Forgot Password' function on the login page. If the old number is permanently dead, the user must contact the MySejahtera Helpdesk online and provide manual proof of identity (such as emailing a photo of themselves holding their MyKad) to request a backend ID transfer by the administrative team.

9. Data Privacy, Terms of Use, and Device Permissions Given the sensitive nature of the data, the Ministry of Health Malaysia enforces strict privacy policies governed by the Prevention and Control of Infectious Diseases Act 1988 and broader data protection frameworks.

- **Data Ownership:** All personal health data collected through MySejahtera is strictly regulated and accessible only by authorized MOH personnel and specific health district officers. The App declares that no data is shared with unauthorized third parties or commercial entities.
- **App Permissions:** To function correctly, MySejahtera requests specific device permissions. 'Camera' access is needed for eKYC scanning and scanning facility QR codes. 'Location' services are required for the Infectious Disease Tracker to map outbreaks relative to the user. 'Files & Photos' access is needed if the user wishes to upload medical documents or download their vaccination certificates as PDFs.
- **User Compliance:** By agreeing to the Terms and Conditions during registration, the user legally commits to providing accurate, non-misleading information. Uploading fraudulent test results or using someone else's identity to log in is a severe violation subjected to criminal investigations by enforcement authorities. The government holds the right to terminate access for any account found violating these legal stipulations.
